non-slip surface treatment

The Most Advanced Anti-Slip Treatment

R10+ is not a coating, but a penetrative treatment that chemically bonds into the surface pores, sitting below the surface, and only reacts when contacted with moisture.

R10+ reduces the risk and danger of slips and falls, the resulting potential for injury, insurance claims & lawsuits.

R10+ can be used on almost all hard floor surfaces, indoor and outdoor, such as ceramic tile, glazed brick, marble, granite, terrazzo, engineered stone, river rock, concrete, quarry tile and porcelain.

R10+ fills in the pores in the surface and reacts instantly with moisture, creating an extremely effective anti slip situation, without affecting the aesthetic beauty of the surface.

R10+ will not discolor or change the look of the floor.

R10+ is quick to apply with minimal disturbance or down time to your organization.

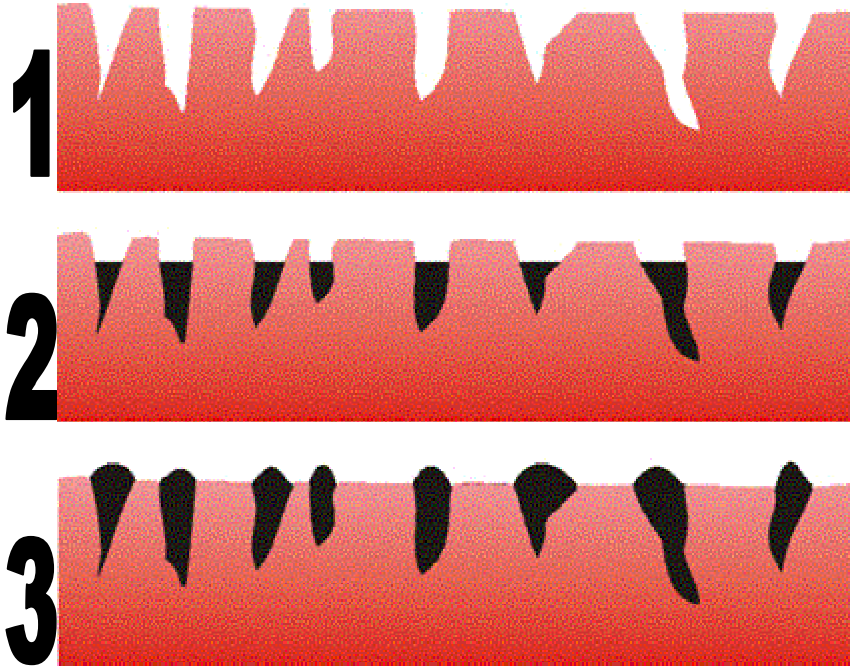

R10+ has a lifespan before re-application of 2-3 years.

non-slip surface treatment

HOW IT WORKS

Picture 1

Untreated Surface

Hard floor surfaces are naturally porous. Water collects, creating a hazardous and slippery surface.

Picture 2

Treated Surface Dry

When the floor is treated with the **R10+AntiSlip System** it fills in the pores just below the floor surface.

Picture 3

Treated Wet Surface

R10+AntiSlip System reacts instantly to moisture, rising above the surface, creating an extremely effective anti-slip condition.
(even moisture from a wet shoe is enough to create the reaction)
